

PROJECT RULES FOR AI DEVELOPMENT ASSISTANT (CURSOR TOOL)

Project Context

Project Name: Cinematic Studio Website Goal: Build a high-end, visually-driven portfolio site for a videography studio. Delivery: Single React + TypeScript + Tailwind CSS file using Shadcn/ui components.

Technical Mandates (MUST FOLLOW)

1. **Stack:** ONLY use React, TypeScript, Tailwind CSS, and Shadcn/ui.
2. **Architecture:** All code MUST reside in a single file (`App.tsx` or similar, if applicable to the execution environment).
3. **Mobile-First Approach (MCP):** Prioritize styling for mobile (small screens) first. Use responsive modifiers (`sm: , md: , lg:`) to adjust layouts for larger screens.
4. **Accessibility (WCAG 2.1 AA):**
 - Ensure all interactive elements have clear focus rings (`focus:ring`).
 - Maintain high contrast ratios (especially with the dark theme).
 - Use appropriate ARIA attributes for all custom UI elements (especially Shadcn components like Dialog, Sheet, and Button).
 - Use semantic HTML (`<main>` , `<section>` , `<nav>`).
5. **Aesthetics:** Implement a sophisticated, dark/cinematic theme with subtle hover effects and smooth transitions (`transition-all duration-300`).
6. **Media:** Use placeholder images or inline SVGs. Do not rely on external images/textures. Video content must be simulated or use an embedded player link placeholder.

Forbidden Actions (DO NOT DO)

1. **External Files:** DO NOT generate separate CSS or JS files. All logic/styling must be inline or within the single React file.
2. **Alerts:** DO NOT use `window.alert()` or `window.confirm()` . Use Shadcn Dialog/Toast for notifications.
3. **Fixed Pixels:** AVOID fixed pixel widths/heights for layout elements; prefer `rem` , `%` , `vw` , or Tailwind utility classes like `w-full` and `max-w-7xl` .
4. **Complex Routing:** DO NOT use `react-router-dom` or similar libraries. For multi-page simulation, use conditional rendering or state-based switching.
